Nationwide forecast API usage

#2798 · verified locally on 2026-10-17 · operator/API guide

The special endpoint appends a Korean nationwide narrative as type 5. Client presentation and multilingual support are deferred to #2803.

1. Read a current publication

```
GET /v000903/kma/special
HTTP 200
Types: [4, 1, 2, 3, 5]
```

Actual isolated response excerpt: real HTTP and Mongo persistence, synthetic provider text based on issue-reported October16 metadata and precipitation.

```
{
  "type": 5,
  "name": "종합예보",
  "announcement": "2026-10-16T08:00:00.000Z",
  "comment": "○ 18일 전국 비\n* 수도권 예상 강수량: 30~80mm\n&lt;img src=x
onerror=&quot;alert(1)&quot;&gt; &amp; 안내"
}
```

2. Interpret time and text

17:00 KST is 08:00 UTC. Keep newline characters. The server escapes HTML metacharacters for the existing HTML binding; do not unescape them. The encoded image tag in the excerpt is inert provider text.

3. Missing or expired narrative

Type5 is omitted when its publication is 24hours old, invalid or unavailable. Warning types1–4 keep their existing behavior. Cache freshness is shortened near expiry. A failed acquisition never re-dates stored content.

Local smoke also verified repeat/new publications, bounded quota exhaustion, warning preservation and exact24h expiry. No live provider, mobile build, deployment or production readback is claimed. See the operator runbook for approved rollout and rollback.
