Domestic forecast memory verification

Isolated forecast-only verification above base c1ae9082; optimized binary f1310443. Captures show retained actual receipts, not a new execution. No production or full API parity claim.

1. Run cold and warm HTTP independently

Build with the repository toolchain, retain and hash the executable, then run seed, diagnostic and http into a new ignored output directory. The HTTP Source starts fresh with its normal 3-second deadline.

Selected actual HTTP receipts: cold 200 in 1670.86 ms; warm 200 in 18.51 / 17.39 ms; identical 42,549-byte bodies.

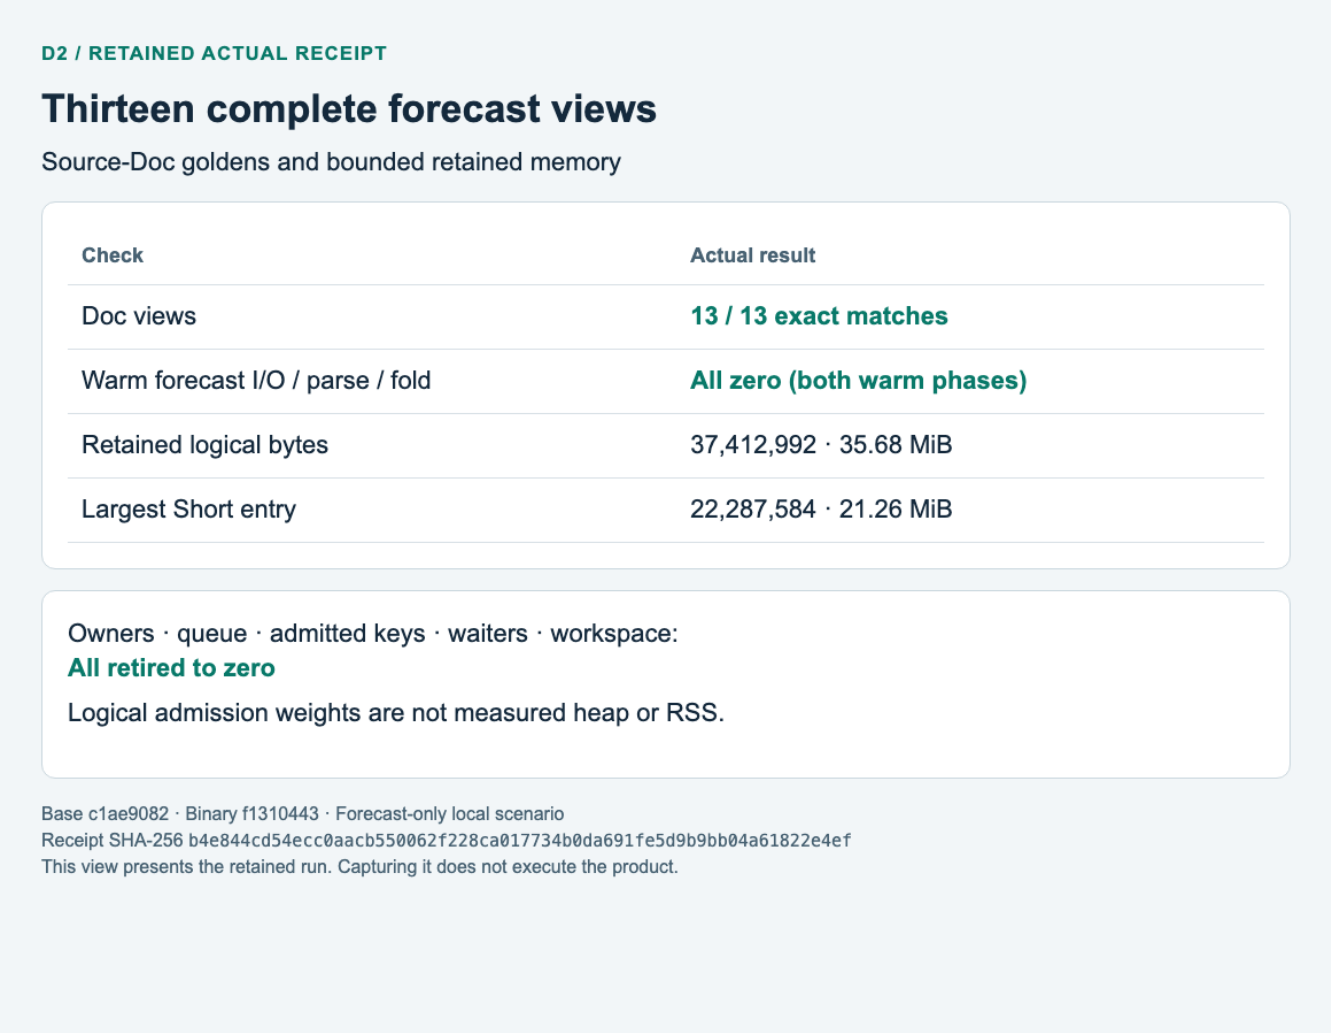

Expected result: Runner and all 3 children exit 0. No priming, live provider call or accepted 502.

Domestic forecast memory verification

Isolated forecast-only verification above base c1ae9082; optimized binary f1310443. Captures show retained actual receipts, not a new execution. No production or full API parity claim.

2. Check all thirteen forecast views

Require all 13 source-Doc golden views and every classified label. Warm forecast I/O, parse and fold deltas must be zero. Logical entry weights do not measure RSS.

Actual 13/13 matches; 37,412,992 logical retained bytes (35.68 MiB). Short: 22,287,584 bytes (21.26 MiB). Limits unchanged.

Expected result: Owner, queue, admitted-key, waiter and workspace gauges retire to zero. No stale or partial success.

Domestic forecast memory verification

Isolated forecast-only verification above base c1ae9082; optimized binary f1310443. Captures show retained actual receipts, not a new execution. No production or full API parity claim.

3. Read supporting input and operational limits

Inspect zone-support and optional counters separately. The original zone-999 fixture is rejected and does not test valid ZoneCache recovery. Keep the production, host and rollback gates open.

Actual zone reads: 1 LIST / 1 catalog / 1 descriptor / 1 raw per request; 2,586 returned bytes, 308 raw. Cold observation stubs: 194 web + 2 ASOS; warm extra: zero.

Expected result: Preserve these limits and the original failed runs. Global resources, full API parity and production eligibility remain unqualified.
